

PocketSmart AI

Date	15 March 2026
Team ID	xxxxxx
Project Name	PocketSmart AI
Maximum Marks	2 Marks

Technology Stack

The source template asks for the technologies used for frontend, backend, data storage, deployment, version control/CI-CD and third-party APIs/tools. Because the uploaded project material does not specify an implemented stack, the choices below are presented as a proposed prototype stack for PocketSmart AI.

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side	React + HTML/CSS	Responsive, component-based interface for entering budgets/preferences and presenting recommendation results.
2	Backend / Server-Side	Python + FastAPI	Lightweight API layer suitable for request validation, budget calculations, recommendation orchestration and integration with AI services.
3	Database / Data Storage	PostgreSQL	Structured storage for user planning inputs, budgets, preferences, recommendation metadata and history.
4	Cloud / Hosting / Deployment	Cloud hosting + Docker	Containerized deployment supports repeatable environments and allows the service to scale as usage grows.
5	Version Control & CI/CD	GitHub + GitHub Actions	Repository-based collaboration, version tracking and automated build/test workflows.
6	Third-Party APIs / Other Tools	Generative AI API + external product/service APIs	Generative AI supports personalized recommendation generation; external APIs provide current product/service information for comparison.

Note: The technology selections above are proposed implementation choices, not claims about technologies already implemented in the uploaded project materials.
